CODE NEXUS INDIA 2026
ROUND 2 — PROJECT SUBMISSION

INKLOOM AI

Your brand. Your voice. Every word.

———————————————————————————

THE ART OF BRAND VOICE

TEAM SPARK SQUAD
Team Leader: Saadhana Shree GK
Team Member: Swathika M.

Organised by: We Code Coders
Category: Brand Governance and Content Management

Live Application: [https://inkloom-ai-wplakcddekun8mvadi4jji.streamlit.app/]
Source Repository: [https://github.com/saaadhana22-bit/inkloom-ai]

> **PROJECT AT A GLANCE**
> Inkloom AI is a brand-governance and content-enhancement platform designed to help emerging businesses maintain consistency in their written communication.
>
> It allows users to define brand preferences, provide written content, review rule-based feedback and explore an enhanced version of their content.
>
> The platform focuses on helping businesses communicate with a more consistent brand identity while keeping human judgement involved in the final decision.
>
> Core Idea: Your brand should have a recognisable voice, regardless of who creates its content.

TABLE OF CONTENTS

- 01. Project Overview
- 02. Problem Statement

- 14. Conclusion

01. PROJECT OVERVIEW

1.1 Introduction

In today's digital environment, businesses communicate with their customers through social media posts, promotional messages, product descriptions and other forms of written content.

However, maintaining a consistent brand identity across all these communication channels can be challenging.

Different people may create content using different writing styles, terminology and expressions. As a result, the brand may gradually lose its recognisable voice.

Inkloom AI was developed to address this challenge.

It is a brand-governance assistant that allows businesses to define their brand preferences and use those preferences while checking and enhancing written content.

The project combines brand preference configuration, rule-based Python processing, feedback and content enhancement within a simple web application.

1.2 Project Vision

Our vision is to make brand consistency easier and more accessible for emerging businesses. We aim to create a platform where businesses can maintain their communication identity without depending entirely on manual content reviews.

1.3 Project Mission

To help businesses communicate consistently by making their brand preferences an active part of their content creation and review process.

1.4 Project Tagline

> **TAGLINE**
> Your brand. Your voice. Every word.

02. PROBLEM STATEMENT

2.1 The Challenge

Businesses invest significant effort in developing their brand identity. They establish their tone, preferred terminology, communication style and messaging guidelines. However, these guidelines are not always followed consistently when content is created by multiple people.

For example:

- **Tone Mismatch:** A business may prefer professional communication, while a newly created post uses an overly casual tone.
- **Inconsistent Terminology:** A brand may have preferred terminology, but different content creators may use inconsistent expressions.
- **Style Deviation:** Promotional messages may not follow the brand's intended communication style.
- **Manual Friction:** Reviewing every piece of content manually can require additional time and effort.

These inconsistencies can weaken the relationship between a business and its intended brand identity.

2.2 Why Does This Matter?

Brand consistency helps businesses develop recognition and communicate more clearly with their audiences. When communication varies significantly between platforms or content creators, customers may find it difficult to recognise the intended identity of the brand. Therefore, businesses need a practical way to refer to their brand preferences while preparing and reviewing written content.

2.3 Our Problem Statement

> **CORE QUESTION**
> How might we help emerging businesses maintain a consistent brand voice across their written communication while making content review and enhancement easier?

03. TARGET USERS

Inkloom AI is designed primarily for:

3.1 Small and Emerging Businesses

Businesses that are building their identity and need a simple way to maintain consistent communication.

3.2 Startups

Early-stage companies that may not have dedicated brand-management teams.

3.3 Content Creators

Individuals responsible for creating social media posts, promotional content and other written material for a business.

3.4 Marketing Teams

Teams that want a reference point for checking whether written content follows their organisation's communication preferences.

04. PROPOSED SOLUTION

4.1 Introducing Inkloom AI

Inkloom AI provides a workspace where users can define brand preferences and use them while reviewing written content. Instead of treating every content review as an isolated task, the application brings the brand's preferences into the content-checking and enhancement process. The current prototype uses rule-based Python processing to analyse content and generate feedback.

4.2 How It Helps

The platform focuses on three main areas:

- **Brand Identity:** Users can define preferences that represent how their business wants to communicate.
- **Content Review:** Users can provide written content for checking against the configured preferences and processing rules.
- **Content Enhancement:** The application provides an enhanced version that users can review and decide whether to use or modify.

4.3 Design Philosophy

Inkloom AI follows three core principles:

- Brand identity should remain consistent.
- Content feedback should be understandable.
- Human judgement should remain part of the final decision.

The platform is intended to support content creators, not remove their control over the content they publish.

05. PRODUCT WORKFLOW

5.1 Step 1 — Define Brand Preferences

The user begins by entering brand-related preferences into the application. These preferences form the reference point for the content review process. The purpose is to establish how the business wants its communication to sound and what guidelines should be considered.

5.2 Step 2 — Enter Written Content

The user provides the text they want to review. This may represent a social media post, promotional message or another form of written communication within the application's text-focused scope.

5.3 Step 3 — Rule-Based Content Processing

The application uses Python-based processing rules to examine the submitted content. The current prototype relies on configured logic rather than a connected generative AI model or external language-model API.

5.4 Step 4 — Review Feedback

The application presents feedback and explanations based on its processing. This helps users understand the observations made by the application rather than simply receiving a changed version of their content.

5.5 Step 5 — Explore the Enhanced Version

The application provides an enhanced version of the submitted content. The purpose is to help users move towards communication that better reflects their configured preferences.

5.6 Step 6 — Human Decision

The user remains responsible for deciding whether to use the suggested version or make further edits. The current prototype supports user choice over the suggested content. It does not implement a formal multi-role approval system.

5.7 Workflow Summary

> **THE INKLOOM THREAD WORKFLOW**
> Brand Preferences ➔ Content Input ➔ Rule-Based Processing ➔ Feedback & Explanations ➔ Enhanced Content ➔ Human Review

06. APPLICATION SCREENSHOTS

This section demonstrates the actual working Inkloom AI application. Insert genuine screenshots from the deployed application in the spaces below. Use large, clear screenshots. Avoid unnecessary cropping that hides important interface elements.

SCREENSHOT 01 — MAIN APPLICATION INTERFACE

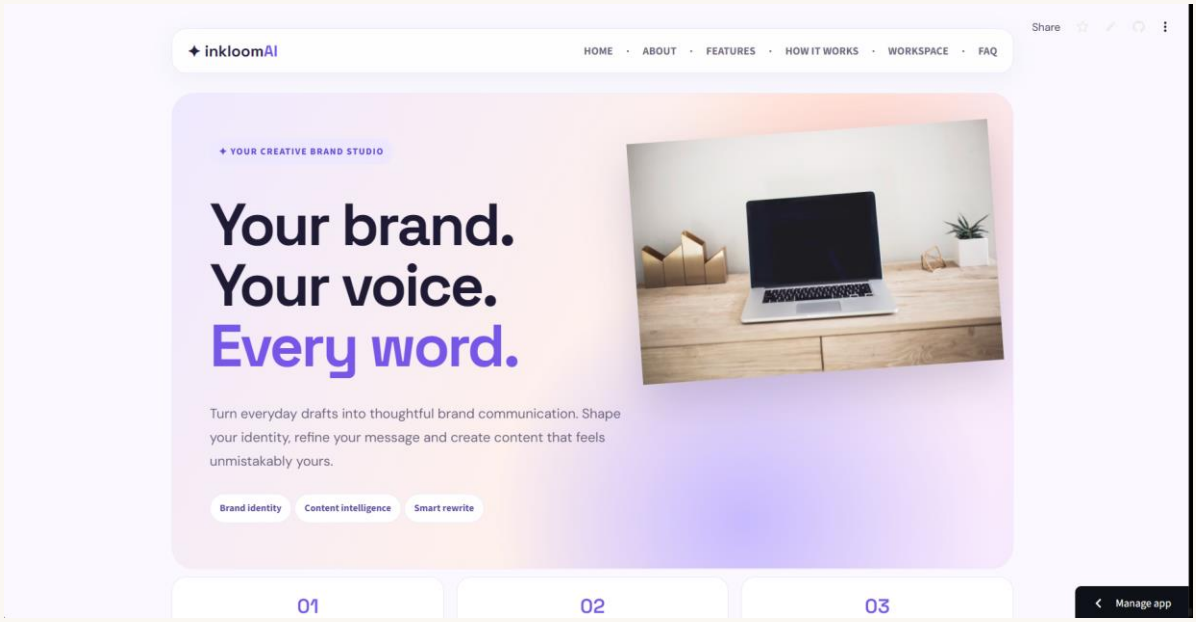

Figure 1: Main workspace of the Inkloom AI application. This screenshot introduces the application interface and gives judges an overview of the user experience.

SCREENSHOT 02 — BRAND PREFERENCES

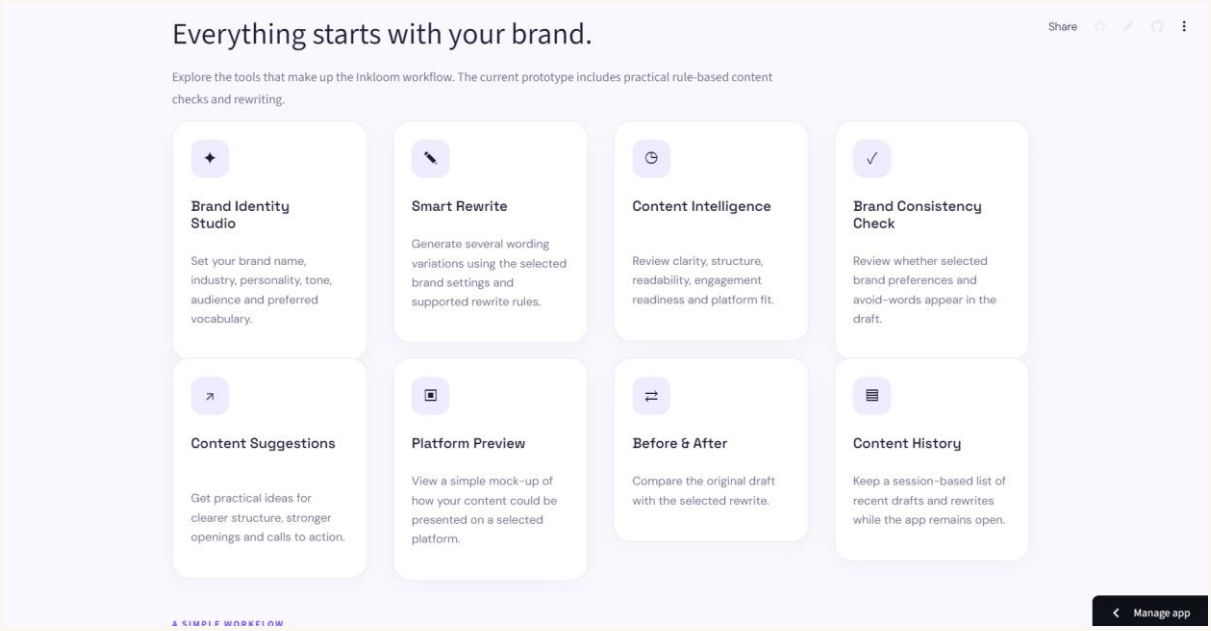

Figure 2: Brand preference configuration. This screenshot demonstrates how users provide brand-related preferences that guide the content review process.

SCREENSHOT 03 — CONTENT INPUT

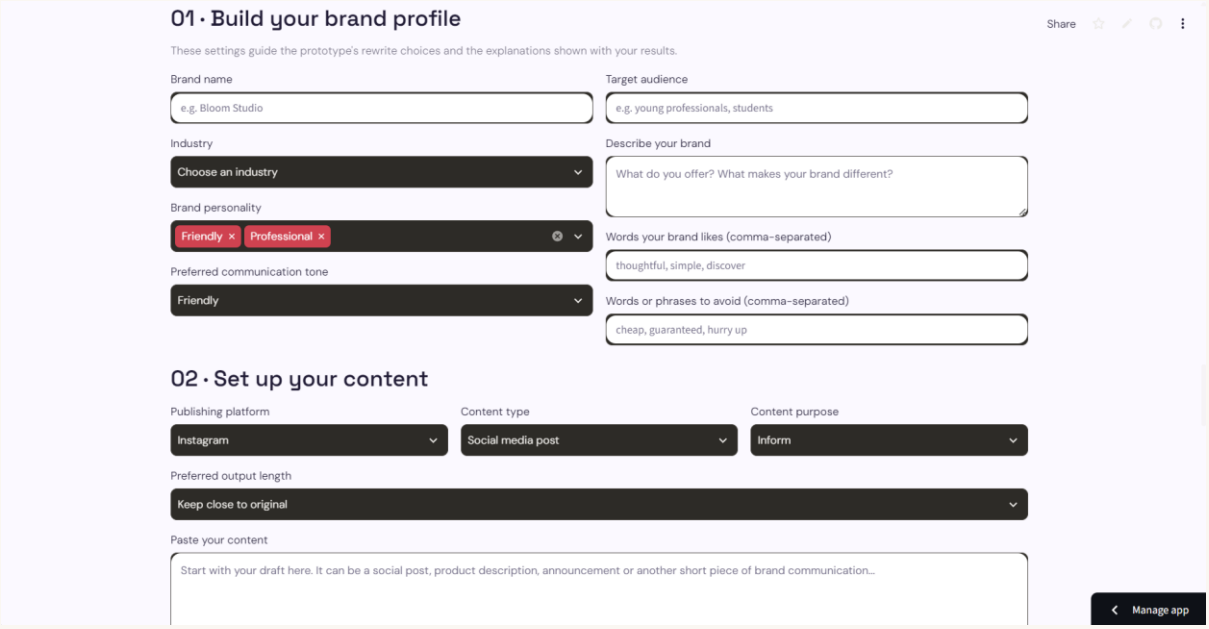

Figure 3: Written content submission interface. This screenshot demonstrates how users provide content for checking and enhancement.

SCREENSHOT 04 — CONTENT FEEDBACK AND EXPLANATIONS

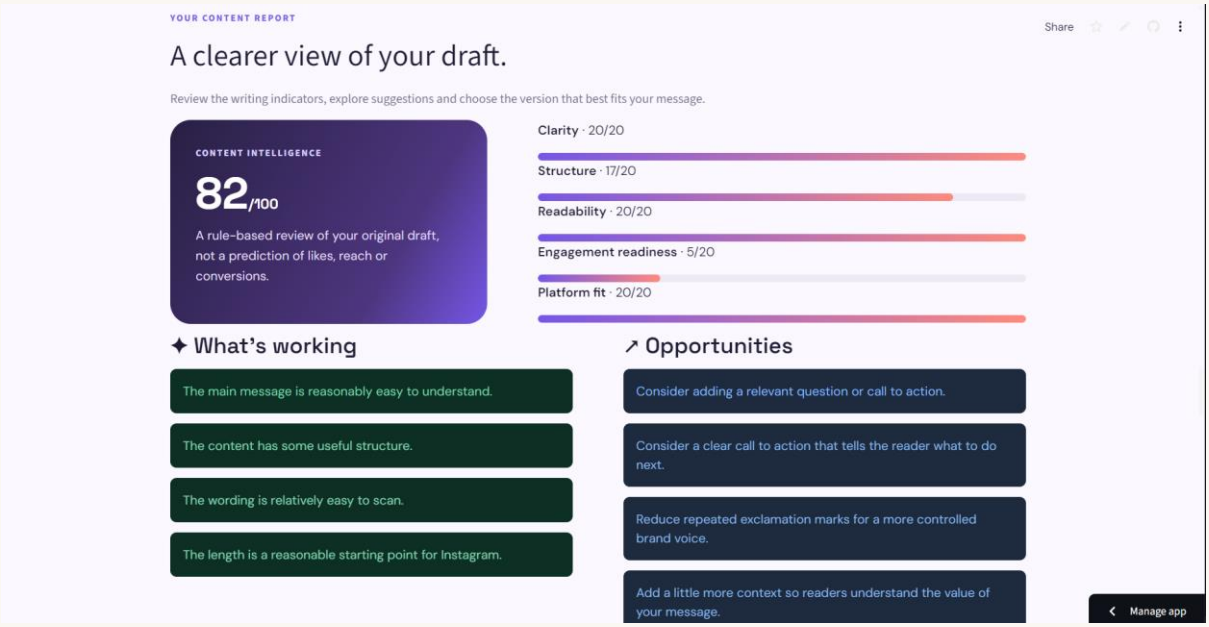

Figure 4: Rule-based content feedback and explanations. This screenshot demonstrates the feedback generated by the application during content processing.

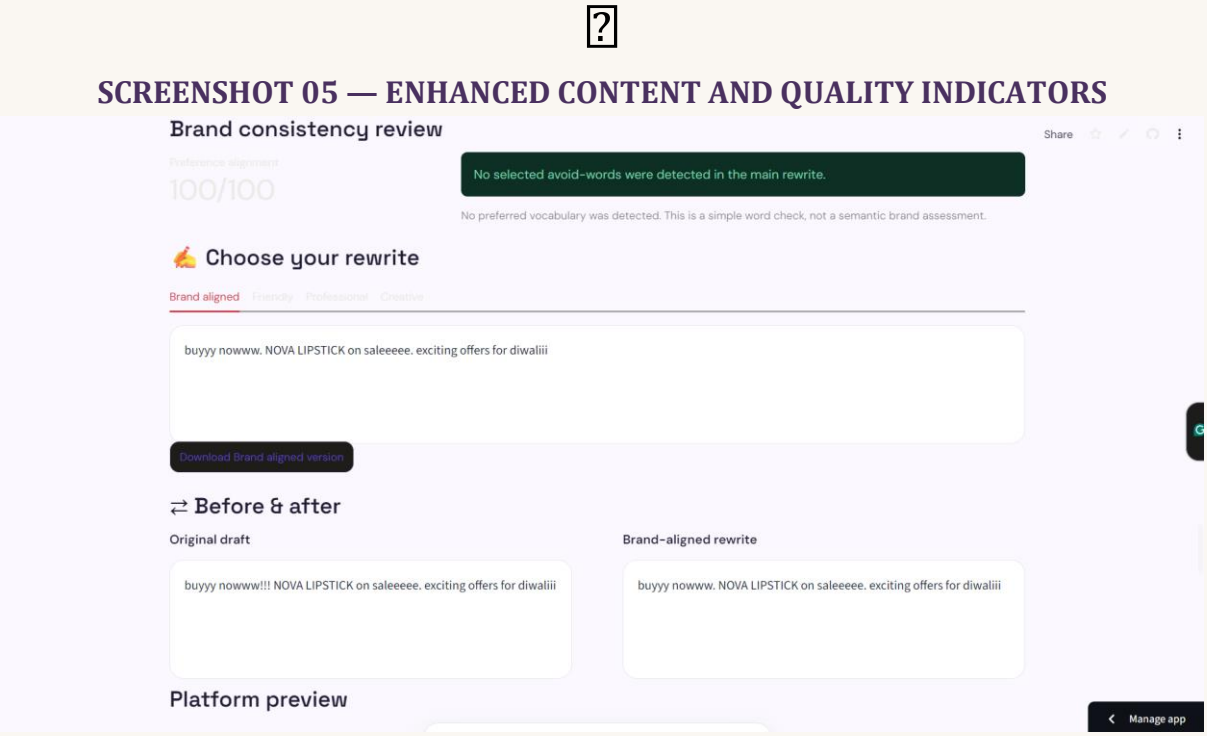

Figure 5: Enhanced content and available quality indicators. This screenshot demonstrates the enhanced content presented to the user for review.

07. COMPLETED FEATURES

The following table summarises the features implemented in the current prototype.

Feature	Description	Status
Brand preference configuration	Allows users to enter brand-related preferences.	**Implemented**
Saved brand preferences	Supports saving brand preferences.	**Implemented**
Text content input	Allows users to submit written content.	**Implemented**
Rule-based processing	Uses Python logic to process submitted content.	**Implemented**
Content checking	Provides content-related feedback.	**Implemented**
Content enhancement	Provides an enhanced version of submitted content.	**Implemented**
Explanations	Presents explanations associated with the results.	**Implemented**
Quality indicators	Displays quality-related indicators in the application.	**Implemented**

Human choice	Allows users to decide whether to use the enhanced version.	**Implemented**

Implementation note: The statuses above describe the current prototype. They should be checked against the deployed application before final submission.

7.1 Features Not Claimed as Completed

The current prototype should not be represented as having the following capabilities unless they are implemented and tested:

- Formal multi-user approval workflows.
- Role-based manager and creator permissions.
- Persistent tracking of recurring mistakes across multiple reviews.
- A connected generative AI model or language-model API.
- Automated visual brand analysis.

These areas are considered potential future improvements.

08. TECHNOLOGY AND IMPLEMENTATION DETAILS

8.1 Technology Stack

Inkloom AI is developed using a Python-based web application architecture.

Technology	Purpose
Python	Core application logic and processing
Streamlit	Web application interface
Rule-Based Python Processing	Content checking and enhancement logic
Git	Version control
GitHub	Source-code repository and project management
Streamlit Community Cloud	Application deployment

8.2 Frontend — Streamlit

Streamlit is used to build the application's interactive web interface. It allows users to interact with the application's features through a browser without requiring a separate desktop installation.

8.3 Backend — Python

Python handles the application's processing logic. The application uses Python-based rules to examine submitted content and produce the corresponding results.

8.4 Content Processing Approach

The current version uses a rule-based approach. This means the application processes content through programmed conditions and logic rather than relying on a connected generative AI model. The approach provides a foundation that can be extended with more advanced processing methods in future versions.

8.5 Version Control and Repository

Git and GitHub are used to maintain and manage the project's source code. The repository provides access to the application's code and supporting project files.

8.6 Deployment

The application is deployed through Streamlit Community Cloud. This makes the working prototype accessible through a web browser.

8.7 Application Structure

The project contains the following main files:
• app.py — Handles the Streamlit application interface and user interaction.
• ai_engine.py — Contains the application's processing and content-related logic.
• requirements.txt — Lists the Python dependencies required to run the application.
• README.md — Provides project information and setup guidance.
• .gitignore — Specifies files and folders that should not be tracked in the Git repository.

8.8 Technical Scope

The current prototype focuses on written content. It demonstrates a practical implementation of brand preference configuration, rule-based content processing, feedback and enhancement. The current implementation does not use a connected generative AI model or external language-model API.

09. CHANGES FROM THE ORIGINAL ROUND 1 PLAN

The original Round 1 proposal described the intended direction and broader architecture of Inkloom AI. During implementation, the project was adapted to focus on delivering a working and accessible prototype. The following table explains the differences.

Original Round 1 Plan	Current Round 2 Implementation
Brand Memory	Brand preference configuration and saving implemented
Text Content Checker	Rule-based content checking implemented
AI-assisted analysis	Replaced with rule-based Python processing
Explanations and suggestions	Feedback and enhanced content provided
Human review and approval	User can review and choose whether to use the enhanced version
Mistake Tracker	Not claimed as implemented; considered a future improvement

SQLite-based architecture	Not included in the current confirmed technology stack

9.1 Why Did We Adapt the Plan?

Our priority during Round 2 was to develop a functional prototype that could be accessed and tested by judges. We focused on implementing the core user journey rather than presenting proposed features as completed capabilities. The decision to use rule-based Python processing allowed us to build the current content-review functionality within the available development scope.

9.2 What Did We Learn?

The development process helped us understand the importance of distinguishing between a proposed feature and a working implementation. It also highlighted the need for a practical architecture that can be improved incrementally.

10. CURRENT LIMITATIONS

Inkloom AI is a working prototype, and several areas can be improved.

10.1 Rule-Based Processing

The current application uses programmed rules rather than a connected generative AI model. This means its analysis and enhancement capabilities depend on the implemented logic.

10.2 Scope of Content

The current prototype focuses on written content. Visual brand analysis and other media formats are outside its present scope.

10.3 Human Approval Workflow

Although users can review and choose whether to use the enhanced content, a formal multi-role approval workflow is not currently implemented.

10.4 Recurring Mistake Tracking

Persistent tracking of recurring content issues across multiple reviews remains an area for future development.

10.5 Future Scalability

As the application develops, additional processing methods, stronger reference management and expanded collaboration capabilities may be introduced.

11. FUTURE DEVELOPMENT — ROUND 3

For Round 3, we propose three meaningful functional improvements that would expand the capabilities of Inkloom AI. These are proposed future developments and are not claimed as completed features.

IMPROVEMENT 01 — HUMAN REVIEW AND APPROVAL WORKFLOW

Objective: Introduce a structured review process that allows content creators and managers to participate in content approval.

Proposed Functionality:
• Allow content creators to submit content for review.

• Introduce review statuses such as Draft, Under Review, Changes Requested and Approved.
• Allow reviewers to provide comments and feedback.
• Maintain a record of review decisions.

Expected Impact: This would make Inkloom AI more useful for businesses where multiple people participate in content creation and approval. It would also provide a clearer distinction between automated feedback and final human approval.

IMPROVEMENT 02 — RECURRING MISTAKE TRACKER

Objective: Help businesses identify patterns in content issues over time.

Proposed Functionality:
• Record recurring issue categories.
• Identify frequently observed content inconsistencies.
• Present summaries of repeated issues.
• Help users understand which brand guidelines may need more attention.

Expected Impact: This would extend the application beyond individual content reviews and help businesses understand their recurring communication challenges.

IMPROVEMENT 03 — BRAND FACT AND REFERENCE CHECKING

Objective: Introduce a structured way to compare written content against approved brand information.

Proposed Functionality:
• Allow businesses to maintain approved product and brand reference information.
• Compare submitted content against the available reference information.
• Flag possible inconsistencies.
• Highlight claims that require human verification.

Expected Impact: This would help businesses reduce inconsistencies in product descriptions and promotional communication. It would also strengthen the role of Inkloom AI as a brand-governance assistant rather than only a writing-enhancement tool.

12. TEAM INFORMATION

Role / Entity	Details
Team Name	SPARK SQUAD
Team Leader	Saadhana Shree GK — Responsible for project direction, concept development, implementation coordination and presentation.
Team Member	Swathika M. — Contributed to the project development and team collaboration.
Organiser	We Code Coders
Hackathon	CodeNexus India 2026

Team Vision

Our team aims to develop practical technology-based solutions that address real-world challenges. Through Inkloom AI, we explored how software can help businesses maintain their identity and communicate more consistently.

13. PROJECT ACCESS AND LINKS

The following links provide access to the working application and source code.

13.1 Live Application

Inkloom AI — Working Prototype: [INSERT CLICKABLE LIVE APPLICATION LINK]

Judges can access the deployed application through a web browser and explore its implemented features.

13.2 Source Code Repository

Inkloom AI — GitHub Repository: [INSERT CLICKABLE GITHUB REPOSITORY LINK]

The repository contains the project's source code and supporting files.

13.3 Access Instructions

- Open the live application using the link above.
- Explore the available brand preference options.
- Enter sample written content.
- Review the feedback and enhanced output.
- Explore the GitHub repository to understand the implementation.

The application should be tested in a private or incognito browser window before submission to verify that the judges can access it without relying on an existing login session.

14. CONCLUSION

Inkloom AI began with a simple observation: businesses may have a clearly defined brand identity, but maintaining that identity across everyday communication is not always easy.

Our project explores how technology can help bridge that gap.

Through the current prototype, we have developed a platform that combines brand preference configuration, rule-based content processing, feedback and enhancement in a single web application.

The Round 2 implementation represents an important step from an initial concept towards a working product.

We also recognise that the current version has limitations. These limitations provide opportunities for further development, particularly in structured human approval, recurring issue tracking and brand reference verification.

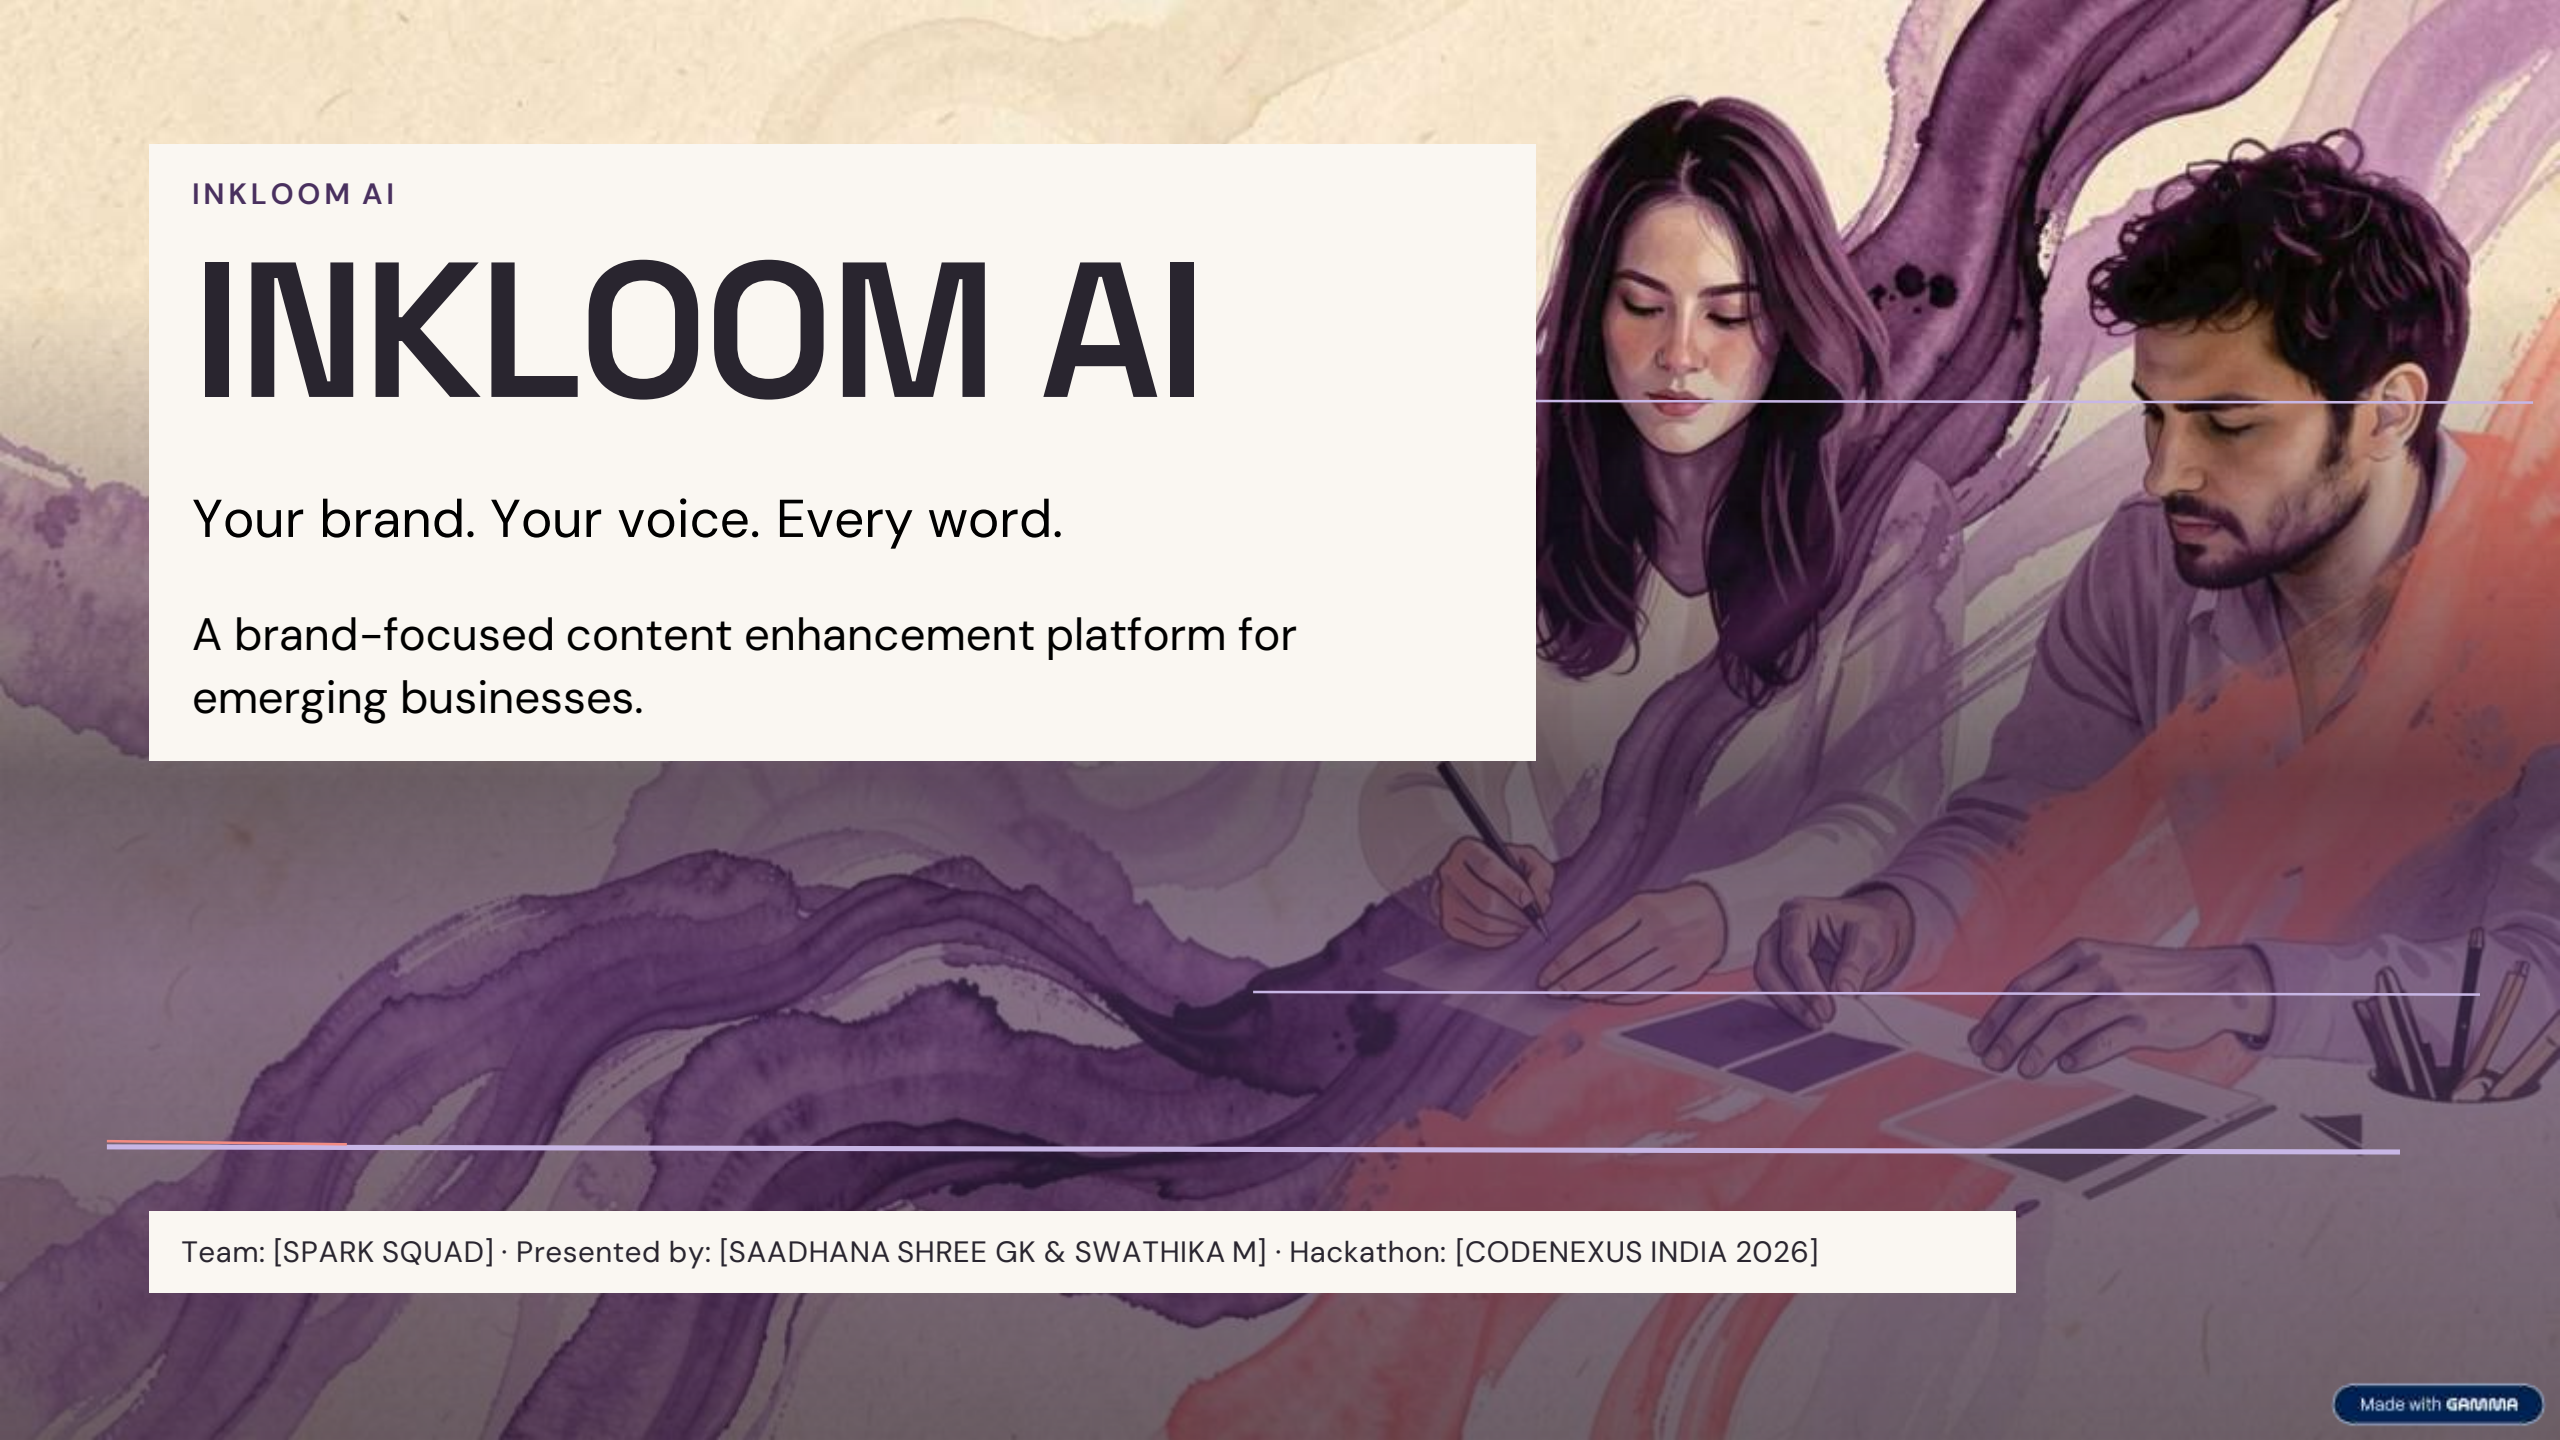

Our long-term goal is to evolve Inkloom AI into a more comprehensive brand-governance platform that helps businesses preserve their identity throughout their communication journey.

INKLOOM AI

INKLOOM AI

Your brand. Your voice. Every word.

A brand-focused content enhancement platform for emerging businesses.

Team: [SPARK SQUAD] · Presented by: [SAADHANA SHREE GK & SWATHIKA M] · Hackathon: [CODENEXUS INDIA 2026]

Made with GAMMA

Every great brand was once a small idea.

Before a brand becomes recognisable, it begins with someone who believes in an idea.
A small team. A limited budget. A different perspective.
But an extraordinary amount of creativity, curiosity and ambition.
Startups are built by people who dare to begin, experiment and create something that doesn't yet exist.
And somewhere along that journey, they must find a way to make the world understand what makes them different.

Target audience

- Early-stage startups.
- Emerging brands.
- Small businesses.
- Entrepreneurs developing their brand identities.

A startup's size should never limit the strength of its voice.

INKLOOM AI

A great idea deserves more than generic words.

Building a brand is not only about creating a product. It is also about communicating its identity.

The challenge isn't simply creating content. It's creating content that feels like your brand.

01 — Inconsistent Communication

A brand may communicate differently across platforms, making its identity harder to recognise.

02 — Generic Content

Content can sound ordinary and fail to express what makes a business unique.

03 — Lost Brand Personality

The personality behind a business may not always come through in its written communication.

04 — Time and Resource Constraints

Small teams often manage multiple responsibilities while maintaining their communication.

INKLOOM AI

Meet Inkloom AI.

Your brand identity, translated into better communication.

Inkloom AI is a brand-focused content enhancement platform designed to help emerging businesses refine written content according to their selected brand identity. Instead of treating every piece of content as generic text, Inkloom AI considers the preferences and personality of the brand behind it.

From knowing your brand to expressing your brand.

UNDERSTAND

Capture the brand's personality, audience and communication preferences.

REFINE

Use selected brand preferences to guide content enhancement.

EXPRESS

Present rewritten content with explanations and content-quality indicators.

Before changing the words, understand the brand.

Inkloom AI follows a structured workflow that considers the brand before refining its content.

Brand Personality: Friendly, professional, bold, minimal, playful, trustworthy, innovative or elegant.

Communication Tone: Friendly, professional, creative, formal or inspirational.

Target Audience: The people the business wants to communicate with.

Word Preferences: Words the brand prefers to use and words it wants to avoid.

Publishing Context: The platform, content type and purpose of the content.

1. Enter brand details.
2. Select brand personality.
3. Choose communication tone.
4. Define target audience.
5. Specify preferred and avoided words.
6. Select publishing platform and content purpose.
7. Paste original content.
8. Generate enhanced content and review the results.

Different brands. Different identities. Different ways of communicating.

Made with GAMMA

DEMONSTRATION

See the transformation.

One brand. One identity. A more intentional way to communicate.

Brand: EarthNote.

Industry: Sustainable stationery.

Personality: Friendly, creative and trustworthy.

Tone: Inspirational.

Audience: Students and environmentally conscious consumers.

Platform: Instagram.

Original content: “We sell notebooks made from recycled paper. Buy now!”

GENUINE INKLOOM AI SCREENSHOT PLACEHOLDER

Use a clearly labelled placeholder for a genuine Inkloom AI screenshot. Do not fabricate screenshots or outputs.

Enhanced content: [INSERT ACTUAL OUTPUT FROM THE WORKING INKLOOM AI APPLICATION]

Explanation: [INSERT ACTUAL EXPLANATION FROM THE APPLICATION]

Quality indicators: [INSERT ACTUAL AVAILABLE INDICATORS]

Made with GAMMA

TECHNOLOGY / WORKFLOW

Designed with purpose. Built with practical technology.

Technology stack:

Python — Core application logic.
Streamlit — Web application interface.
Rule-Based Processing — Current content enhancement engine.
GitHub — Source-code management.
Streamlit Cloud — Deployment.

01 — Brand Customisation

Brand identity configuration, personality selection, tone selection and audience definition.

02 — Content Preferences

Preferred words, avoided words, platform selection, content type and purpose.

03 — Content Enhancement

Brand-guided rewriting, tone adjustments and length preferences.

04 — Content Insights

Explanations of changes, content-quality indicators and rewritten output for review.

Technical workflow: User Input → Brand Preferences → Python Rule-Based Processing → Enhanced Content → Results.

Important: The current application uses a rule-based Python engine. It does not currently use a connected generative AI model.

DIFFERENTIATION

Not just better words. More intentional brand communication.

BRAND-FIRST THINKING

Brand preferences are configured before content enhancement.

CUSTOMISABLE COMMUNICATION

Users can define their preferred tone, personality and vocabulary.

CONTEXT-AWARE REFINEMENT

The selected platform, content type and purpose guide the processing workflow.

Current limitations

- Rule-based processing has limited contextual understanding.
- Output quality depends on selected preferences and implemented rules.
- The current version does not use a connected generative AI model.
- Complex brand instructions may require more advanced processing.

We know what our current version can do, what it cannot do, and what we want to improve next.

ROADMAP

From a content tool to a brand communication ecosystem.

Our goal is to help emerging brands communicate with consistency as they grow.

PHASE 01 — STRENGTHEN THE FOUNDATION:

Improve existing processing rules; expand brand customisation; refine content explanations; improve user experience.

PHASE 02 — INTELLIGENT ENHANCEMENT — PROPOSED:

Integrate an authorised generative AI service; improve contextual understanding; develop more flexible brand-aligned rewriting; explore advanced content analysis.

PHASE 03 — CONNECTED BRAND ECOSYSTEM — PROPOSED:

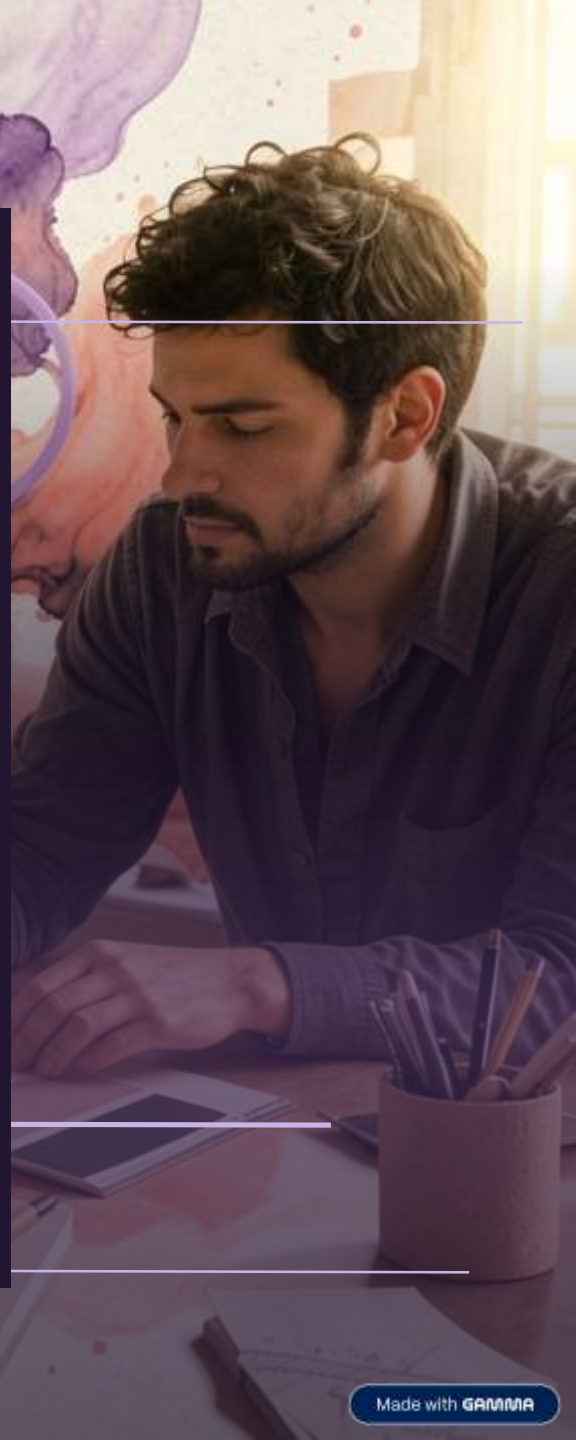

Brand voice memory; multi-platform content adaptation; content calendar integration; brand consistency analysis; support for multiple brand profiles.

INKLOOM AI

Every brand deserves to be heard.

Every recognised brand once started with an idea.
Someone believed in it. Someone took the first step. Someone dared to build something different.
We chose to focus on those beginnings — the startups, the emerging businesses and the people working to turn their ideas into something meaningful.
Because we believe that a brand is more than what it sells.
It is what it stands for, what it communicates and what people remember.
And we want to help those brands express that identity, one word at a time.

Your brand. Your voice. Every word.

Made with GAMMA
